

PUBLIC SECTOR

Structured project oversight, built for public accountability.

Aurora supports government project management with clear governance, audit-ready records, and transparent reporting — designed around how public sector projects are actually run and overseen.

Governance and compliance

Data residency	Data is hosted within Africa, aligned with Kenya's Data Protection Act 2019.
Audit readiness	Every action is logged in an immutable audit trail, structured to align with KENAO audit requirements.
Procurement compliance	Variation and change tracking is built around PPADA (2015) variation limits, with automated threshold alerts at each stage.
Role-based governance	Every user's access is scoped to their role and mandate — no one sees more than their function requires.
Reporting formats	Reporting templates are structured to match standard audit and oversight formats, including KENAO-aligned reports.

Core capabilities

- Portfolio oversight across projects, regions and mandates
 - Offline-first field data capture with GPS-tagged photo evidence
 - Pre-built project templates: schools, roads, water points, health facilities
- Approval routing and variation tracking that follow your procedures
 - Automated progress, budget and compliance reporting
 - Optional public-facing project gallery for community accountability

How engagement works

01 Initial conversation	We learn about your mandate, scale, and current systems — no obligation, no sales pressure.
02 Tailored walkthrough	We show you Aurora configured around a scenario relevant to your context.
03 Documentation	We provide the information your procurement or evaluation process requires — capability statements, security documentation, references.

Roadmap transparency

IFMIS integration is planned as a future capability. We will always state plainly what is available today versus what is on the roadmap.
